

## Introduction

# Construction site management base

The purpose of the site management base is to create an easy-to-use site management interface (API) for site managers and preparers and a tool for visualizing site indicators for project managers and business managers. It makes it possible to gather all the necessary data from the Electricity specialty for the management and monitoring of the site.

This interface will be linked to a database. One for each new project. It will not be necessary to access the database to fill it in manually. This will be completely transparent to the user. The interface will allow it to exploit the data in this DB in an intuitive way without knowing how it works. The tools available on this interface will be multiple and will allow good management and better visualization of the site.

Statistical page of the future version of the site management database

# Preamble

This document aims to briefly summarize the site management base that I have put in place on the Gowind EAU project and to present its future version with a view to a significant improvement in the way in which electricity specificity yards are managed in the field of shipbuilding.

This document is not intended to be a detailed record of the database developed for the project in VBA in Excel for the mentioned project. Some concepts are really specific to the profession and can be difficult to understand for the uninitiated. The lines of code and the details of each function will also not be described in this document.

## Cable book & databases

██████████ Marine carries out the study and installation of the entire electrical part on board ships of all types. The main entry data for any electrical site nevertheless remains the same every time: it is the Cable Book where we will find the reference of each cable of the ship and all the information related to it, i.e.:

- A list of each electrical equipment of the ship
- A list of all the premises on board
- A list of all the sections used
- A list of penetration from the cable routings created

From a single Excel file containing the cable book, it is therefore possible to retrieve all the necessary information and deploy the tool that will allow the management of the construction site. From this same data source, it is therefore possible to set up the tool that will allow its best management.

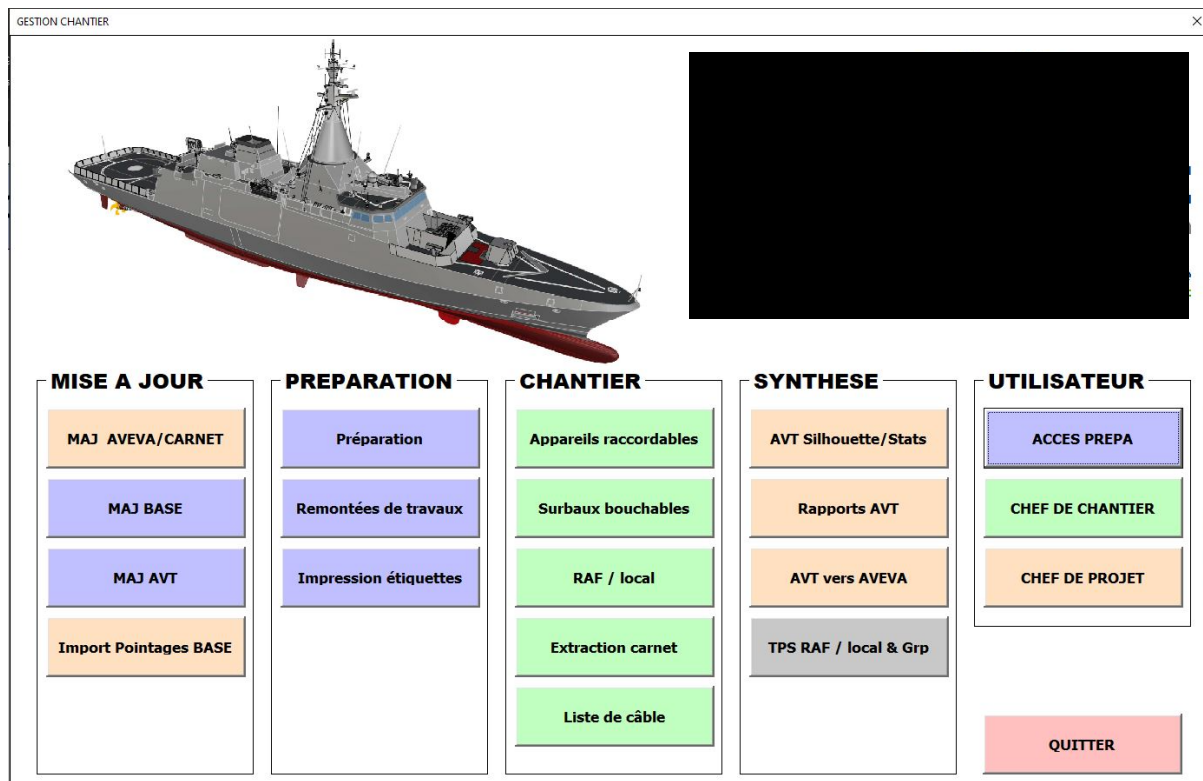

There is a Master base and two other independent bases. One base per ship. The master database makes it possible to make the link between customer data (██████████) and our data (██████████), it is on this basis that we will inform the scales, constrained lengths or routines. It is this base that is at the center of the others. It is only accessible by one user.

On large projects such as corvettes, the electricity profession is broken down according to the different professions below:

- Welding
- Cable path laying and locksmithing
- Installation of devices
- Cable cut
- Cable pull
- Connection
- Checks
- Filling penetration

# Current version: VBA & Excel interface

## INTERFACE

*The interface of the site management base*

The user interface is as follows (see image above). There are several possible accesses depending on the users who use it such as the site manager (in green), the preparation (in blue) and the project manager (in salmon).

Accesses make it possible to avoid user errors and to offer only the necessary tools per post. Site manager access is accessible without a password. Preparer and user access are accessible by password. The password is known only by user functions.

The lines of VBA code (macros) are behind each of the buttons on the interface to perform an action.

## UPDATE BASE

This function allows you to update a quantitative state on a good number of columns in the different tabs of the database such as:

- Cable scales and characteristics (unit time of drawing and bounding)
- Cable characteristics (constrained lengths, routings, cable diameter, cable weight, NGD)
- The calculation of automatic meters and routings
- The calculation of the number of hours per cable according to their lengths
- The number of cables per overstruses and the total area taken by them in order to be in line with BV standards on the filling rate of oversles
- The number of cables per device
- The number of cables and the length per system
- The number of cables and the length per local
- The number of cables and the length per group

## PROGRESS UPDATE

This function allows you to update a progress report on many columns in the different tabs of the database such as:

- The progress in number of cables by penetration and the percentage of filling of the penetration
- The progress as a percentage of the draw, installation and connection per device
- Progress in number and percentage of cable and length by systems
- Progress in number and percentage of cable and length per room
- Progress in number and percentage of cable and length by group

Automatic information according to the following rules:

- If a cable is passed and connected on one side then it is cut
- If a cable is connected to the holder and to the end then it has passed
- If a cable is controlled then it is connected to the holder and the end

This automatic information must be done according to two criteria in order to apply a double verification.

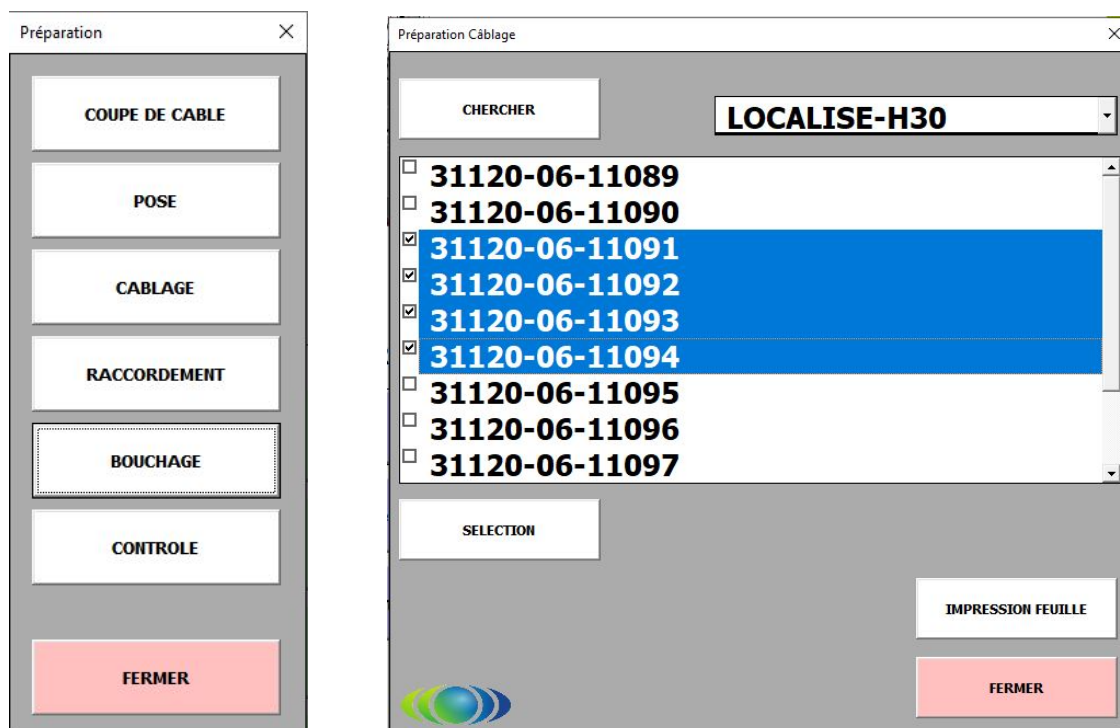

## PREPARATION

This function makes it possible to generate the escalation sheets by profession. These sheets will be used on the construction site to raise progress. These sheets are generated differently according to the profession:

- Cable cutting: sheets are generated by cable group
- Cable draw: sheets are generated by cable group
- Connection: sheets are generated by devices
- Filling penetration: the leaves are generated by decks

After clicking on the "Preparation" button, we click on the job on which we want to prepare the sheets:

Example of preparation for generated the lift sheets for the cable pull of the "LOCALISE-H30" group

All the sheets of the group will be generated in PDF and stored in a "LOCALISE-H30" folder. The binders are then prepared by group by editing a cable list and each escalation sheet.

Each time, a unique number is incremented and corresponds to a profession, a cable and its index. This number is indicated on the "CABLE CART" tab in the blue columns on the view below.

N° FEUILLE	DATE EDITION FEUILLE TIRAGE	AVT TIRAGE CABLE	DATE DE TIRAGE DU CABLE	NOMDU / DES TIREURS	REMARQUES TIRAGE	CODE SEMAINE TIRAGE
T5462	23/07/2021	1	28/10/2021	KILLIAN_DEPARPE		2021-543

T21319	18/03/2022	1	07/04/2022	THIERRY_LE_NY		2022-514

## DAILY TASK UPDATE

This function allows you to inform the progress of the site with the work sheets that are returned from the site (lift sheet).

For each profession, the rule is as follows: A lift sheet (depending on its profession) = a cable.

We indicate the number indicated on the escalation sheet, click on "search" and then check that it is the right cable. We enter the name of the person who carried out the work, a possible remark and then on "enter AVT" which will have the effect of informing the status of the cable in the "CABLE BOOK" tab with the date of the day of the information and its week code (example: 2022-S24). This week code will allow you to have statistics per

week.

N° FEUILLE	DATE EDITION FEUILLE TIRAGE	AVT TIRAGE CABLE	DATE DE TIRAGE DU CABLE	NOMDU/ DES TIREURS	REMARQUES TIRAGE	CODE SEMAINE TIRAGE
T5462	23/07/2021	1	28/10/2021	KILLIAN_DEPARPE		2021-543

T20358	14/03/2022	1	15/06/2022	LEO_QUITTOT		2022-524

## CONNECTABLE DEVICES

In order to avoid making the too early connection of a device (on board the cables coiled to an equipment can give the impression that all the cables are in shifts when it has none), this function makes it possible to establish a list of all the devices whose all the cables are in the position and can therefore be connected 100% and thus avoid having to return to an equipment several times.

## SEALABLE CABLE PENETRATION

This function makes it possible to establish a list of all the overs that can be blocked, which therefore means that all the cables that pass through this crossing have been pulled.

This function requires that all routings be entered in the database.

## REMAINS TO BE DONE BY LOCAL

This function makes it possible to establish a list of all the work to be carried out in a given room:

- Cable still to be pulled
- Device still to be installed
- Cable still to be connected

## CABLE LIST

This function makes it possible to establish a list of cables according to different possible parameters:

The screenshot shows a window titled "Liste de câble" with a close button (X) in the top right corner. The window contains three dropdown menus, each with a radio button to its left. The first dropdown is labeled "LOCAL" and has "L3030" selected. The second dropdown is labeled "GROUPE" and has "BLOC PASSERELLE - D01 VERS D02" selected. The third dropdown is labeled "APPAREIL" and has "86350-00-11049" selected. Below these dropdowns are two radio buttons: "LISTE COMPLETE" and "CABLE MODIFIE". At the bottom of the window are two buttons: "EXPORT LISTE" and "FERMER".

The room will be highlighted in blue if the filter is carried out on it.

The device will be highlighted in blue if the filter is carried out on it.

# ADVANCE SILHOUETTES/STATISTICS

This function makes it possible to update the silhouettes of ships by trade in order to show the progress reports by deck segment, the progress curves and the overall progress percentage of the trade.

There are two silhouettes, one with a percentage of advancement showing with a color code the advancement by bridge section. This view allows you to quickly view the areas that are advancing and those that are blocking.

The color code is as follows:

CRITERE	COULEUR
X < 30%	Red
30% < X < 60%	Orange
60% < X < 80%	Yellow
X > 80%	Blue
X = 100%	Green

Silhouette of the ship on the cable cutting loom

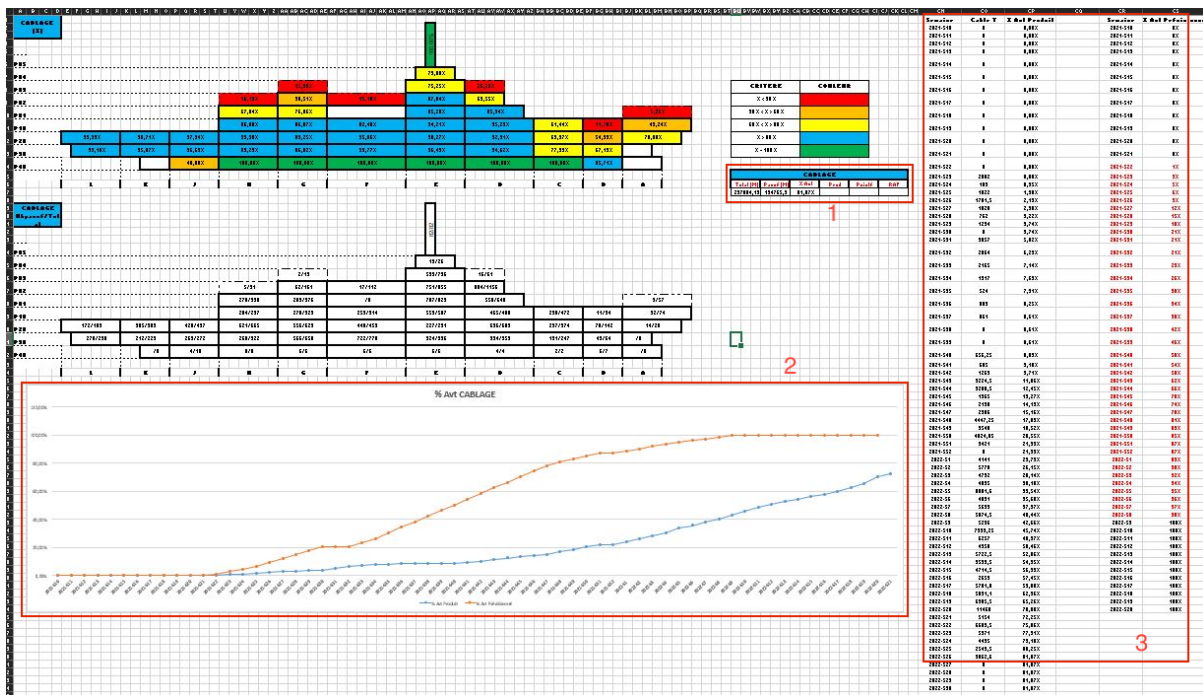

Silhouette of the ship on the cable pulling loom

Silhouette of the ship on the connection loom

On the trade tabs of the ship silhouettes, we also find the progress curves (2), the overall progress percentage (1) of the trade and the results per week as well as the forecast curve (3).

## **PROGRESS REPORTS**

This function makes it possible to generate a PDF showing all the progress of the ship silhouettes by profession and which can thus be transmitted to the customer.

## **PROGRESS TO AVEVA**

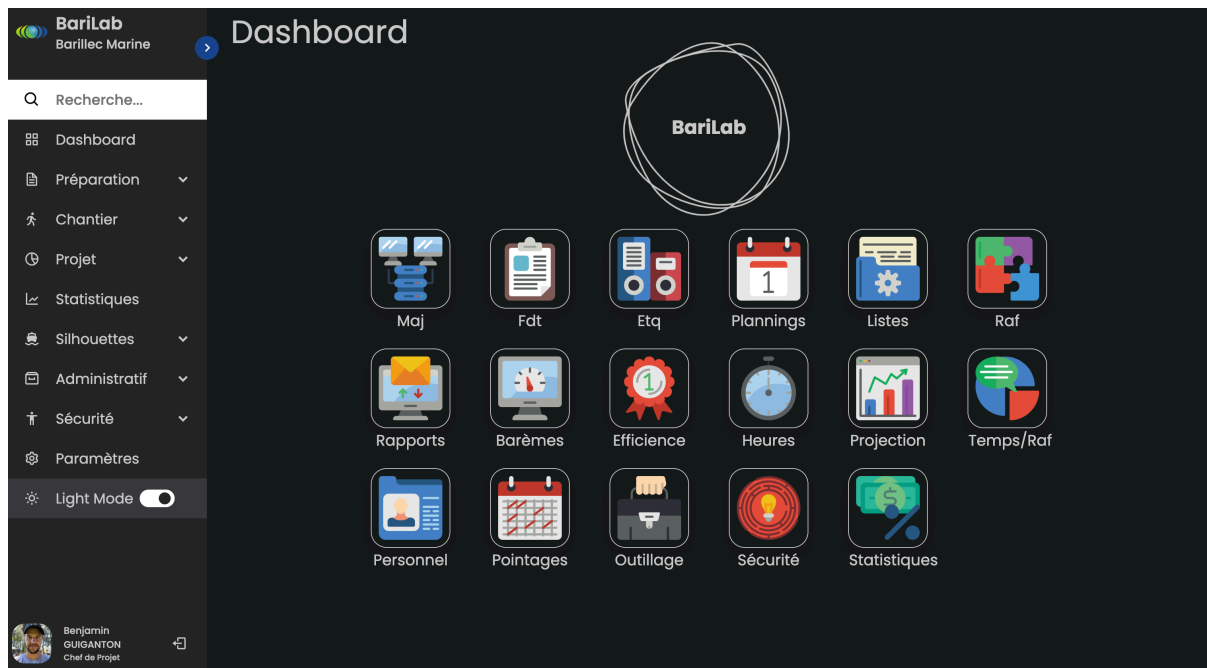

This function allows you to generate an Excel extraction of the cable book with the cable progress reports, the system progress tab, the device progress tab and the penetration progress reports tab.

This extraction makes it possible to send the progress reports to the customer according to his criteria. The [REDACTED] database is large and has a certain amount of information that is not to be transmitted to the customer such as efficiency scales, the names of people, etc.

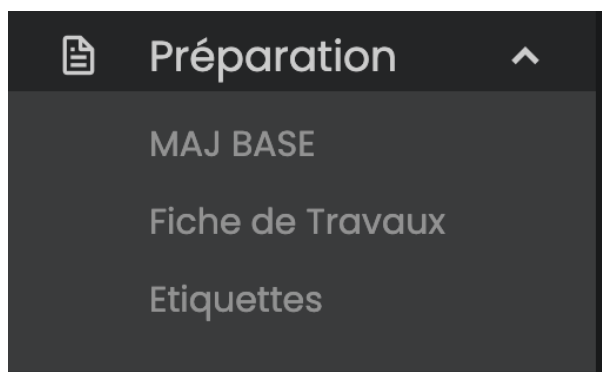

# Future version: WEB interface, Excel API Javascript

## DASHBOARD

This page will contain the shortcuts of the available tools and will allow the user quick access to them:

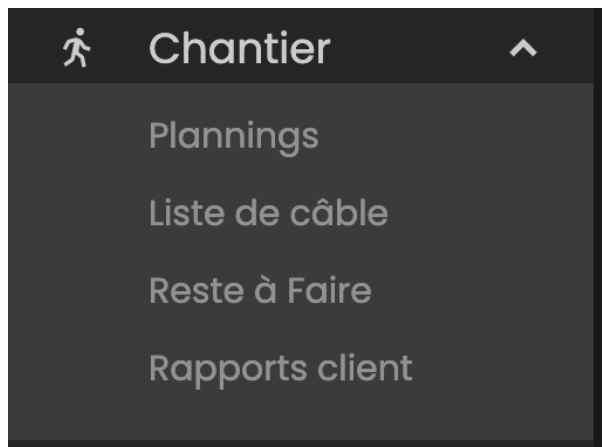

## PREPARATION

This section will be used mainly by the preparation team and will contain all the necessary tools that are described in the previous chapter and that will take up the same principles of logic and operation with improvements following the feedback on using the first-generation interface.

This section will therefore contain basic updates, the editing of work sheets, the printing of labels.

## SITE

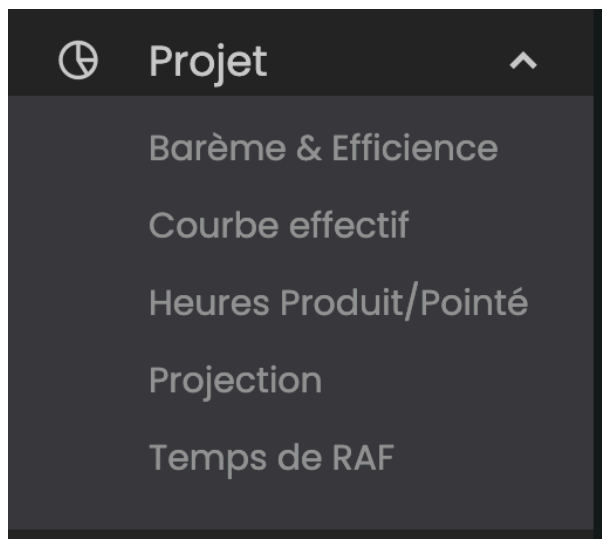

This section will contain the necessary tools for site managers or team leaders and will be mainly adapted for use for the production and management of the site.

This section will therefore contain the personnel management schedules, the edition of cable lists according to several criteria, all the rest to be done so that the construction site

knows where they are and that it can project itself. It will also include editing the progress so that the site manager can know where he is on his site and transmit it to the customer.

## PROJECT

This section is intended for the project manager and business managers so that they can best understand the progress of the construction site/project and thus stay as close as possible to the actual developments, having a clear and factual understanding of the site's status.

They will then be able to redefine the scales according to the professions, anticipate the rest to be done to project themselves financially, know

the hours produced and compare them to the hours set and visualize projection curves.

This section will therefore contain the following elements: Scales & efficiency, workforce curves, hours produced/pointed, projections and remaining times to be done.

## STATISTIQUES

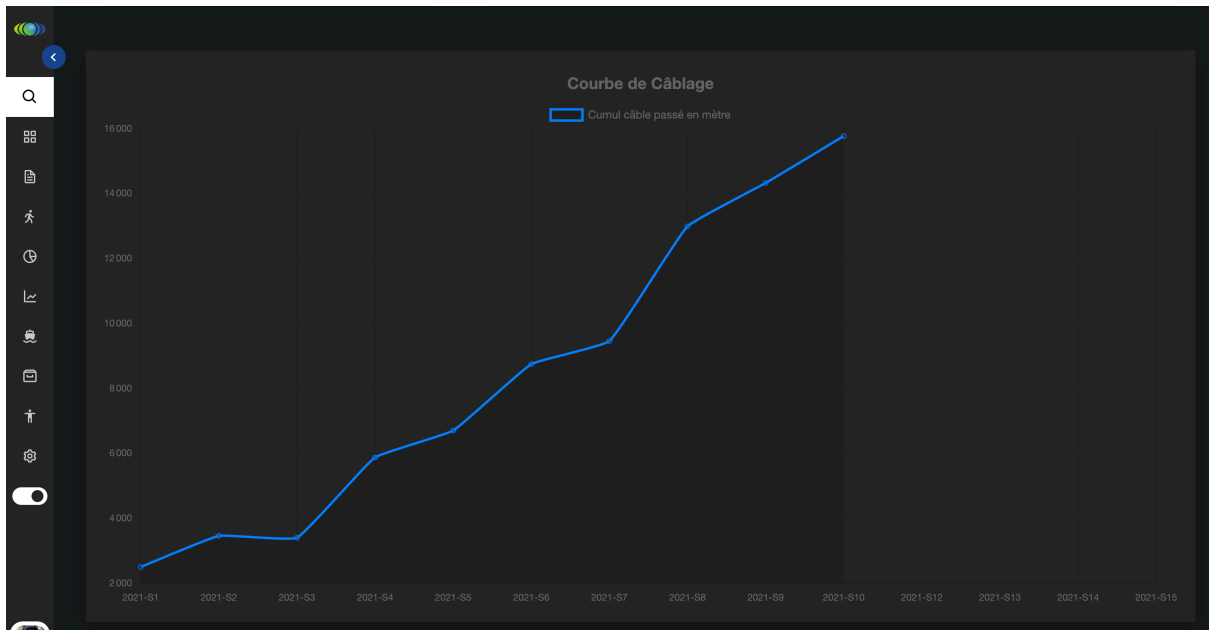

This section will be accessible to all users and will allow them to know at a glance the important figures of the project they are working on. All the actors in the project will have the figures in mind and the progress of the project and the volume it represents will then no longer be a secret to anyone.

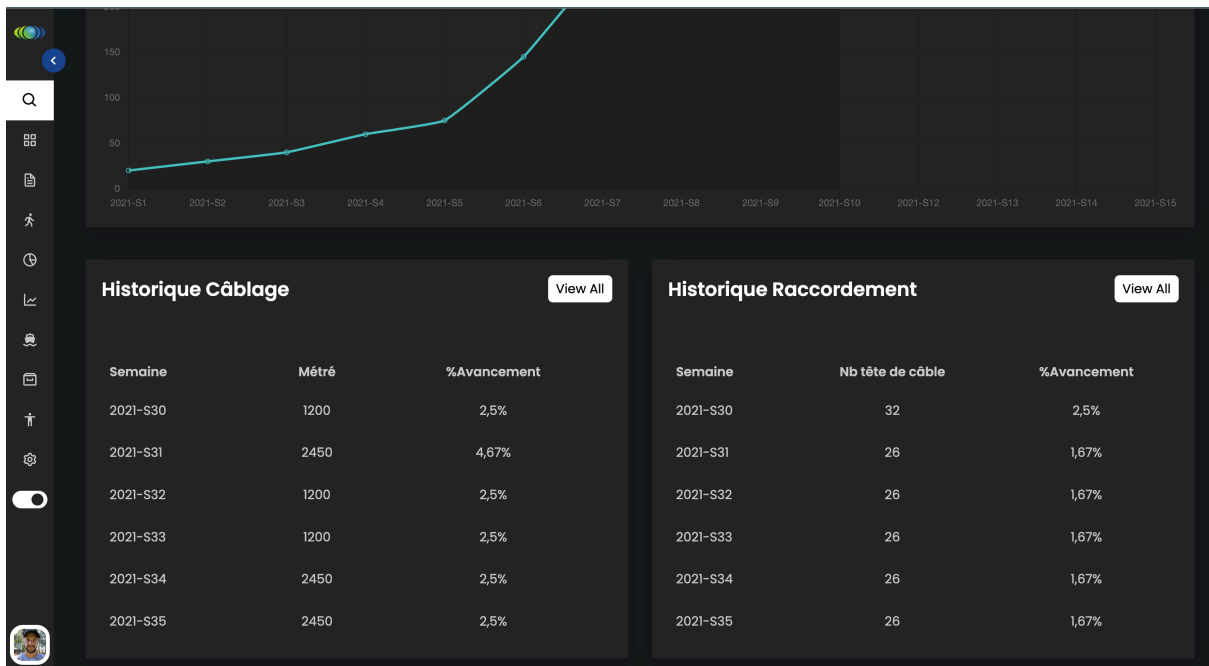

The figures that show the volume of the project and what has been achieved.

The volume of hours to be produced and what has been pointed out so far.

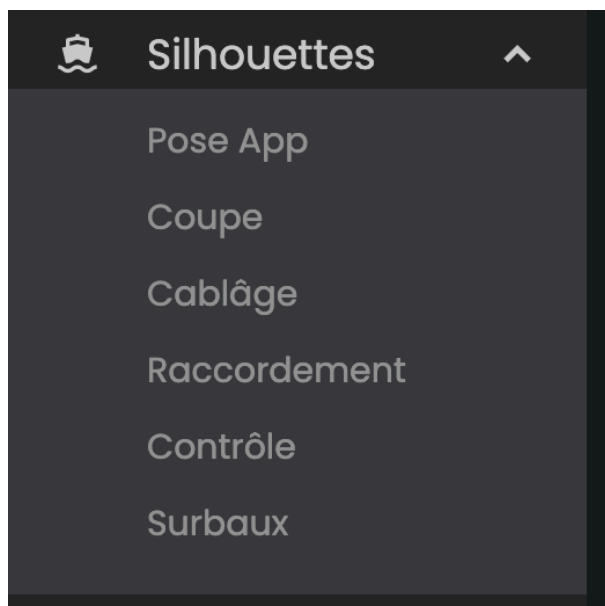

The wiring progress curve (one of the two main professions in the electricity industry)

The figures made per week of the two main professions of the electricity specialist

# SILHOUETTES

This section will allow you to visualize the silhouettes by profession.

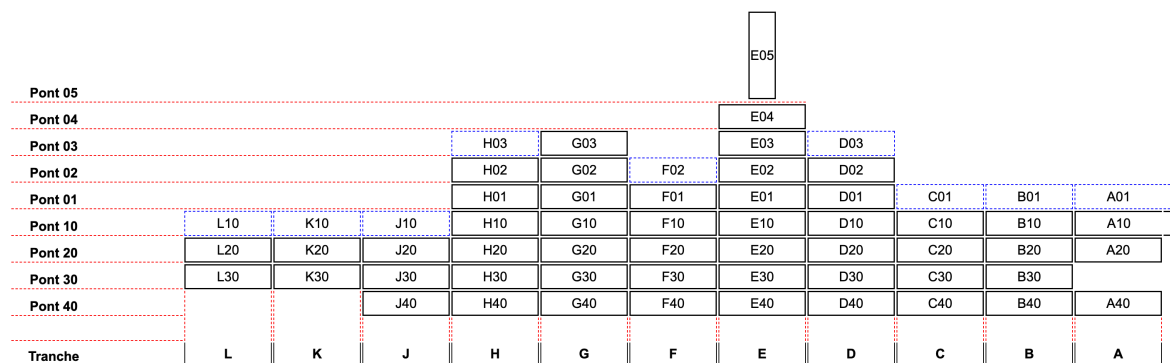

To use the same principle as the old version of the database described above, the user will be able to view the advancements by profession with two ship silhouettes: a silhouette with the percentage of overall advancement per area with a color code and another silhouette with the number of achieved on the total to be achieved.

Total	Réalisé	% Avts
250 000	125 000	50 %

  

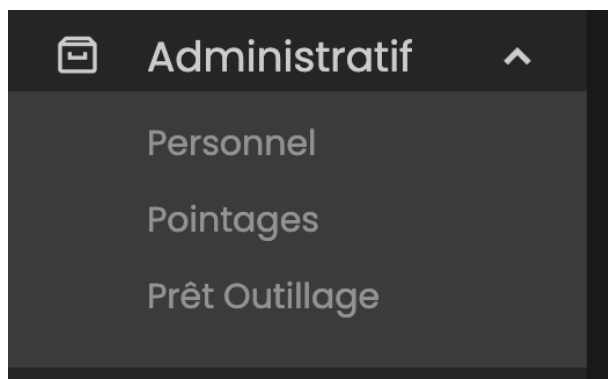

Avts < 30 %	Avts >= 30 %	Avts >= 50 %	Avts >= 80 %	Avts = 100 %
-------------	--------------	--------------	--------------	--------------

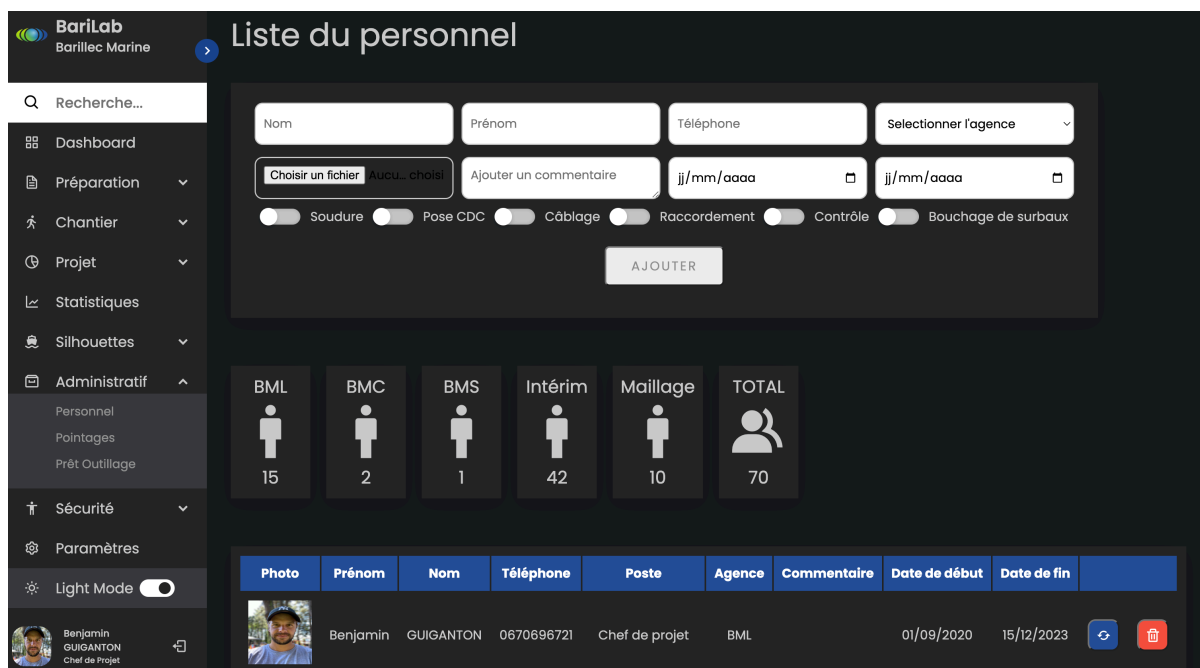

## % Avancement par tranche pont

## ADMINISTRATIVE

This section will include the management of staff, their scores and possibly the management of tools that may have been made available and assigned to a person.

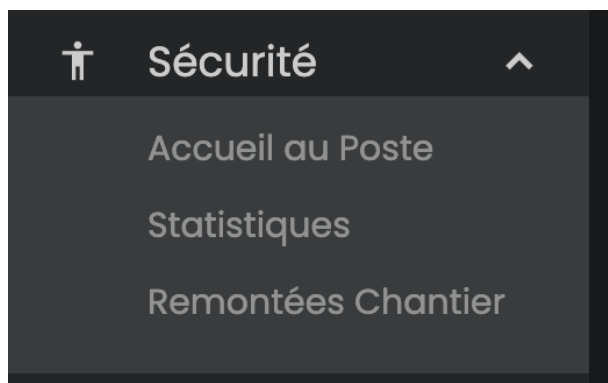

This tab allows you to inform all the staff present on the current site, to inform each new person and their essential information.

It also allows you to visualize the number of people present and differentiate them according to their categories and the type of profession they carry out.

This makes it possible to establish a list of staff and to know the date on which they began their mission or their end date of missions, to have a trombinoscope, to identify their position on the current project.

## SECURITY

This section will include the reception at the station of each newcomer. It will be presented in the form of a presentation video and a quiz and will make it possible to judge on the newcomer's knowledge in terms of safety and thus be able to develop the aspects he will not master before starting work. This also makes it possible to trace the

history of all the people who have passed on the site.

This section will also contain site reports on anomalies they may have encountered or incidents/accidents that have occurred and will thus make it possible to highlight statistics to gauge the level of danger of a site.

## PARAMETERS

The settings page will allow the user to choose the font and display in order to customize the use of the tool and improve its comfort.

## LIGHT/DARK MODE

The tool will have a light and dark mode to improve the user experience.

Benjamin GUIGANTON

## USER

The use of the tool will be done by connecting under its session. The tool therefore allows user management and its use is personalized.
